

Design of photonic nanostructures via chirality induction:

A model system towards enantioselective catalysts

Chiral photonics nanodevices

Goldhelices

Chiroptical properties?

Circular Dichroism (CD)

- Chiroptical absorption of polarized light

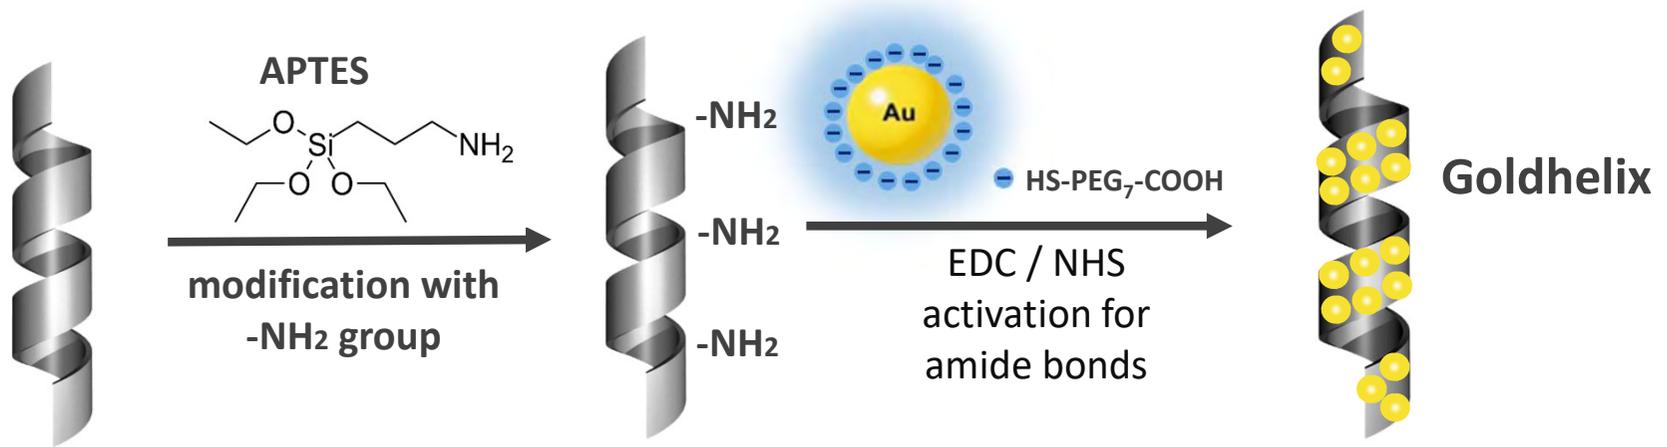

For chiral samples:

$$\Delta A = A_L - A_R \neq 0$$

$$C_L \neq C_R$$

$$g_{abs} = \frac{\Delta A_{CD}}{A} \approx \frac{\theta_{abs} [mdeg]}{32982 * A}$$

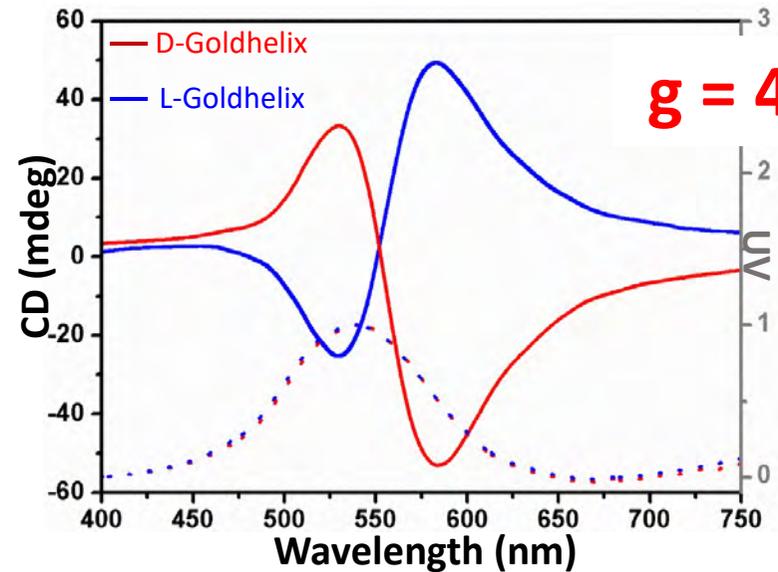

Chiral photonics nanodevices

Goldhelices

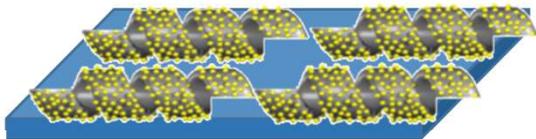

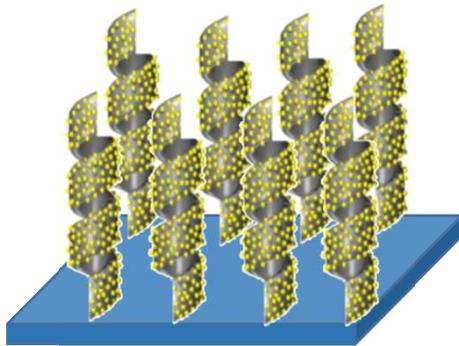

CD signal at the plasmon wavelength

Applications?

What can we do with these Goldhelices?

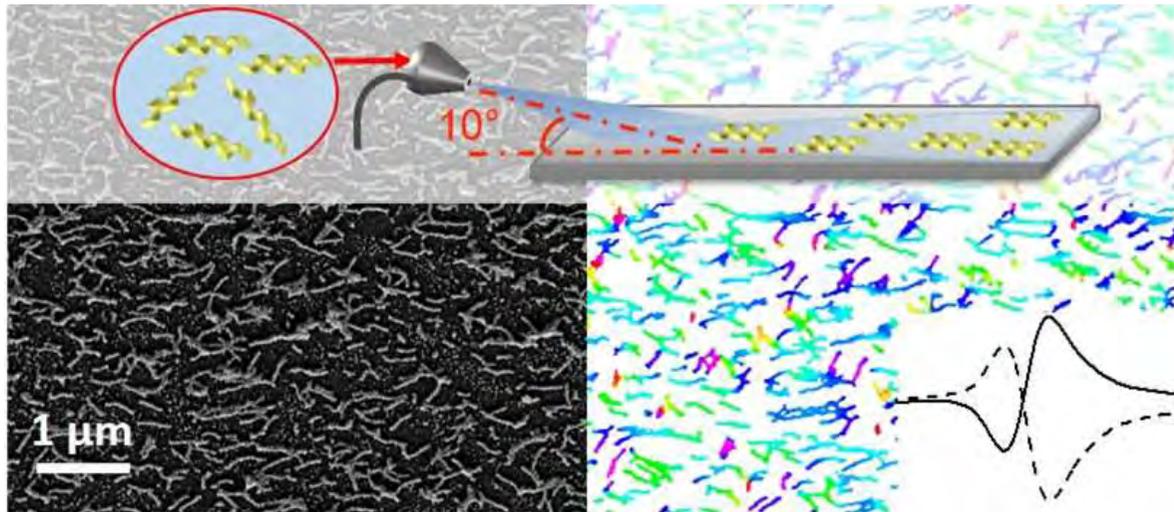

2D and 3D organization
towards macroscopic devices

Tune the optical properties

Macroscopic devices

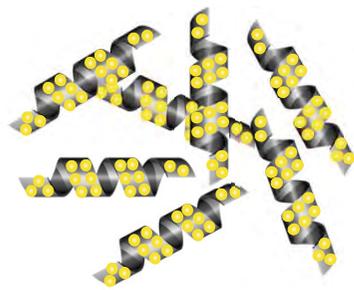

2D orientation by Grazing Incidence Spraying

Coll. Matthias Pauly, ICS

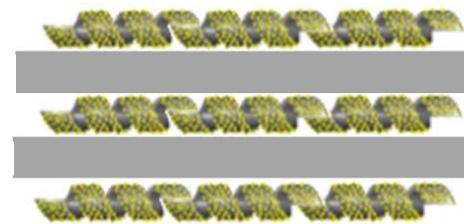

Coll. Yann Battié, LCPA2MC

Non-oriented

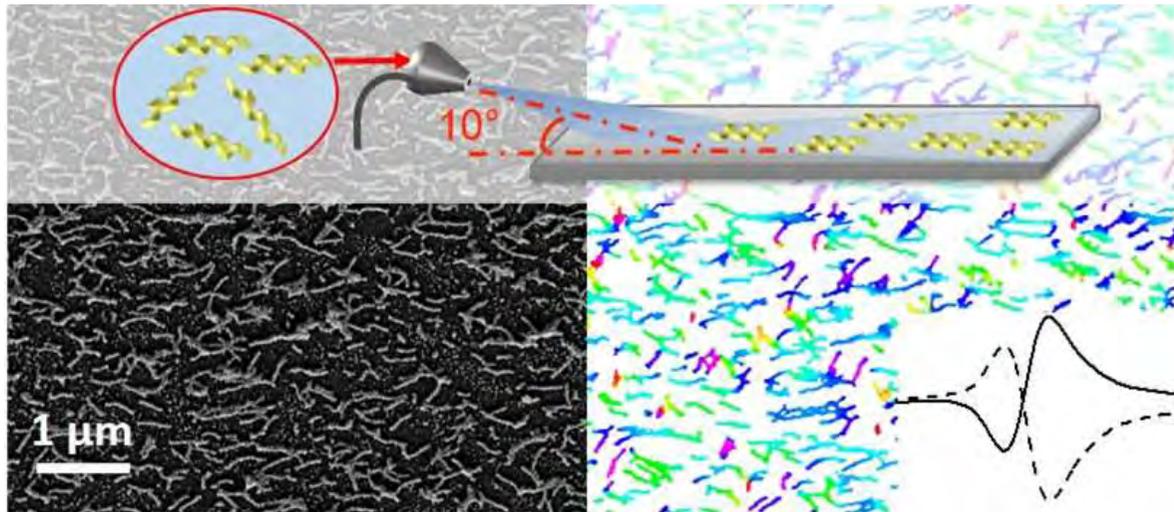

VS

Oriented

Macroscopic devices

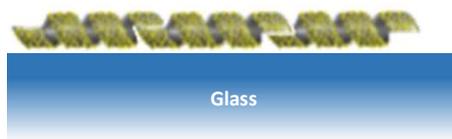

2D orientation by Grazing Incidence Spraying

Coll. Matthias Pauly, ICS

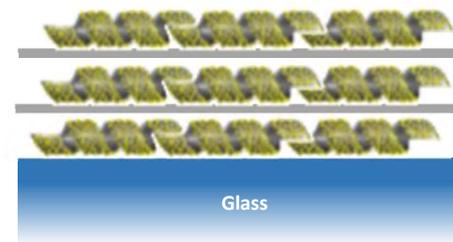

Coll. Yann Battié, LCPA2MC

Monolayer

VS

Multilayers

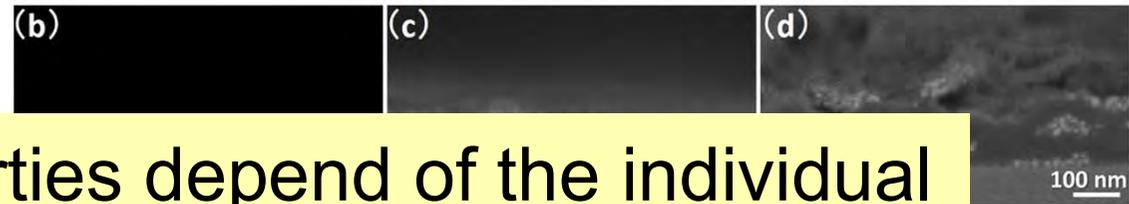

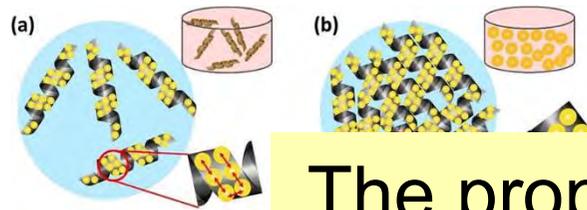

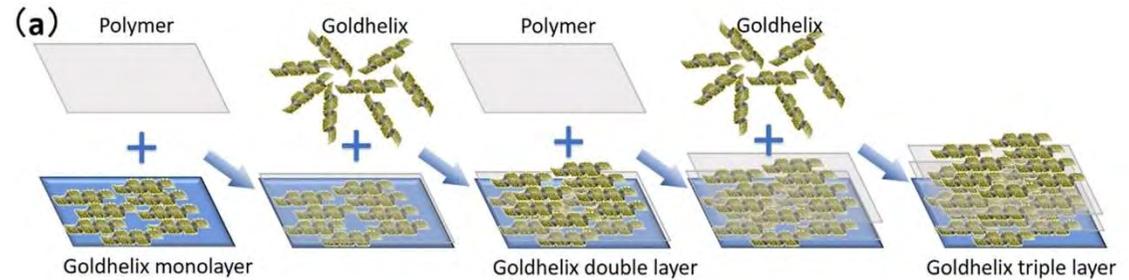

Macroscopic devices

2D orientation by Grazing Incidence Spraying

Coll. Matthias Pauly, ICS

Coll. Yann Battié, LCPA2MC

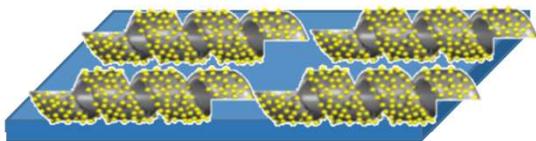

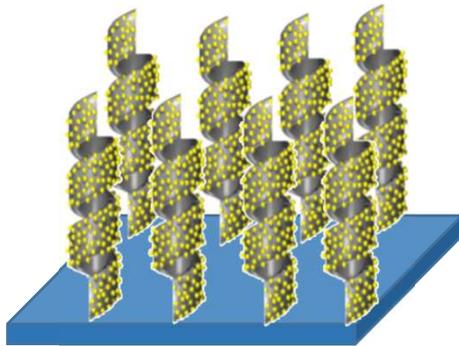

The properties depend of the individual objects AND their assembly

Sample	Bulk	Monolayer	Multilayers		Monolayer	Multilayers (3 layers)		
			Gap			Gap		
			0 nm	56 nm		1 nm	13 nm	33 nm
LD	0	0	0	0	0.038	0.051	0.035	0.045
g-factor (.10⁻³)	4.4	4.3	0	3.7	4.3	1.3	1.8	4.4

Applications?

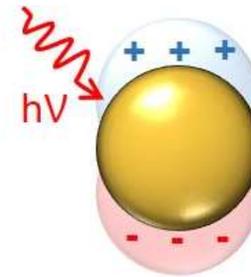

What can we do with these Goldhelices?

2D and 3D organization
towards macroscopic devices

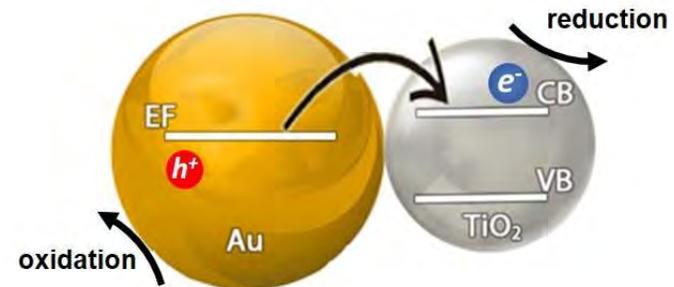

Tune the optical properties

A step towards enantioselective
photocatalysis?

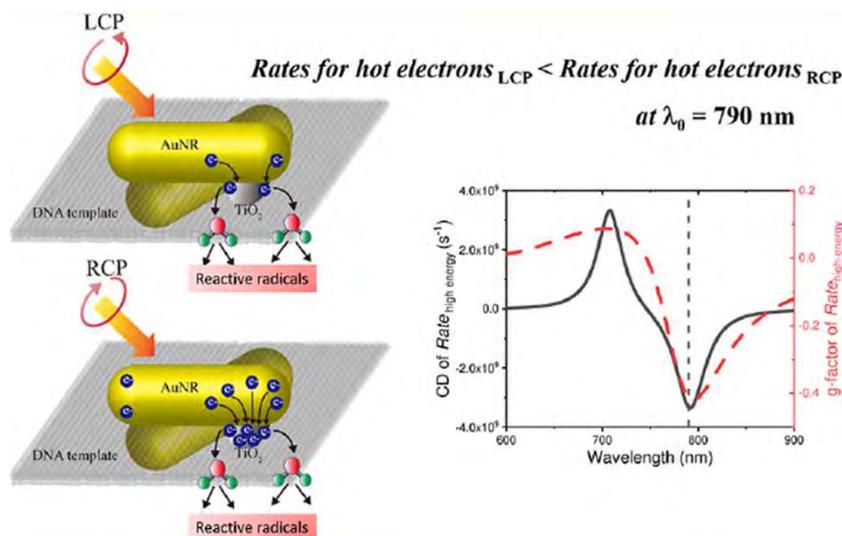

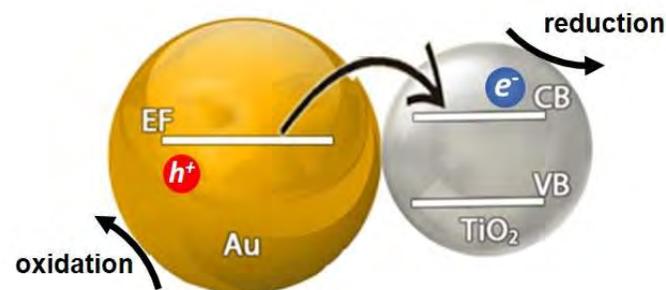

Using the chirality of this plasmon in photoatalysis?

A preliminary result with hot charge carriers

A step towards enantioselective photocatalysis?

Hot charge carriers can be created when a **high-energy photon of electromagnetic radiation (such as light) strikes a metal**. The energy from the photon can be transferred to an electron, exciting the electron out of the valence band, and forming an electron-hole pair.

Chiral Plasmonic Nanocrystals for Generation of Hot Electrons: Toward Polarization-Sensitive Photochemistry

Tianji Liu,^{†,‡,§,¶} Lucas V. Besteiro,^{†,§,¶} Tim Liedl,^{||} Miguel A. Correa-Duarte,[⊥] Zhiming Wang,^{*†} and Alexander O. Govorov,^{*†,§,¶}

A step towards enantioselective photocatalysis?

The Goldhelices: a model system

Coll.: - Miguel Comesana-Hermo (ITODYS, Paris)
- Miguel Correa-Duarte (Vigo Univ.)
- Alexander Govorov (Ohio Univ.)

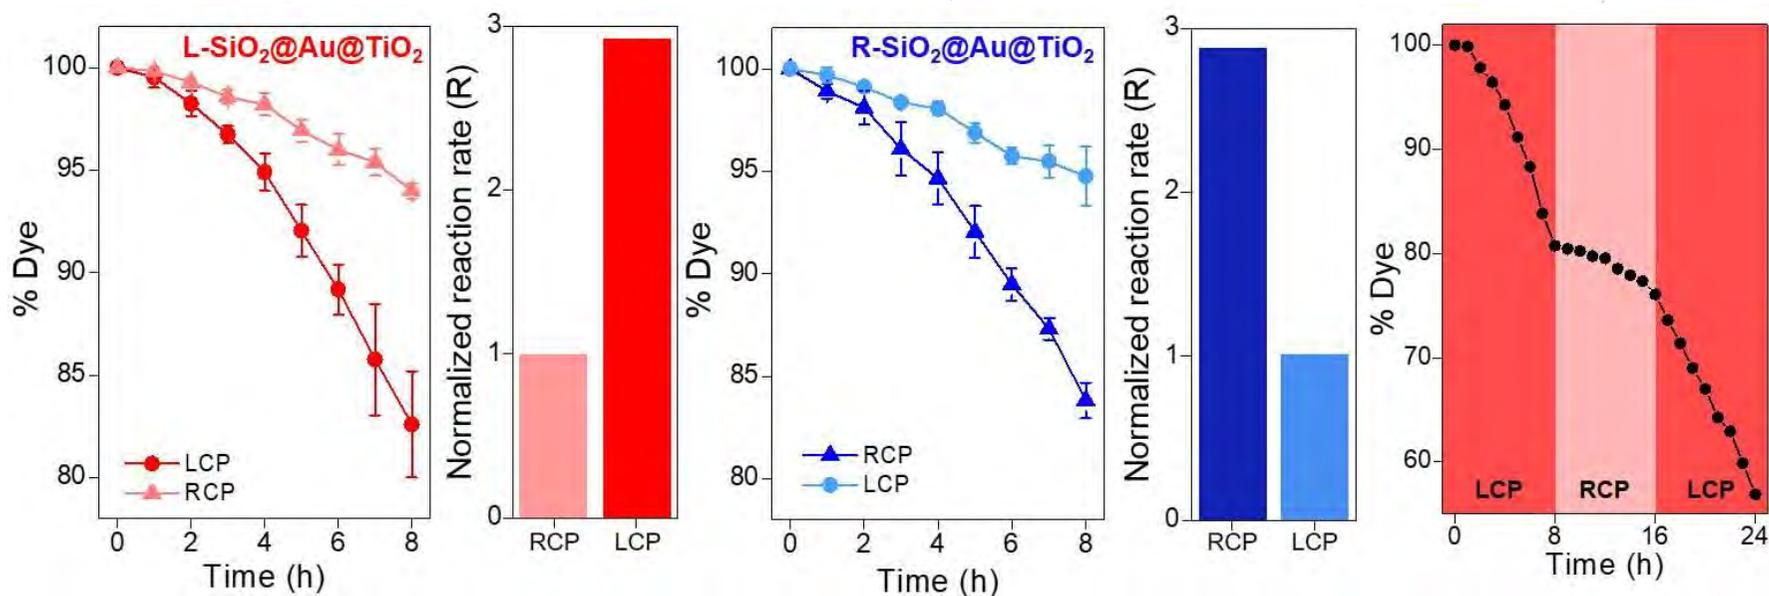

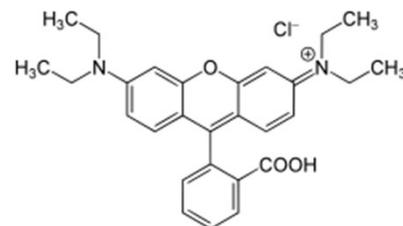

Goldhelix ($d_{\text{GNP}} = 11 \text{ nm}$) + TiO_2 NPs $d=5 \text{ nm}$.
Electrostatic deposition via LBL.

The photo-transformation of rhodamine B (RhB) has been chosen as model photocatalytic reaction in order to demonstrate the asymmetric response of the hot carriers with respect to the helicity of the circularly polarized light (CPL).

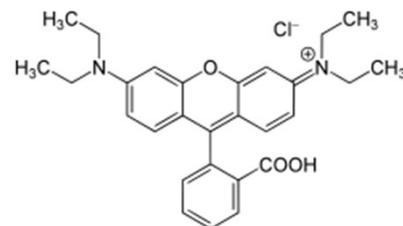

A step towards enantioselective photocatalysis?

Selective degradation of RhB

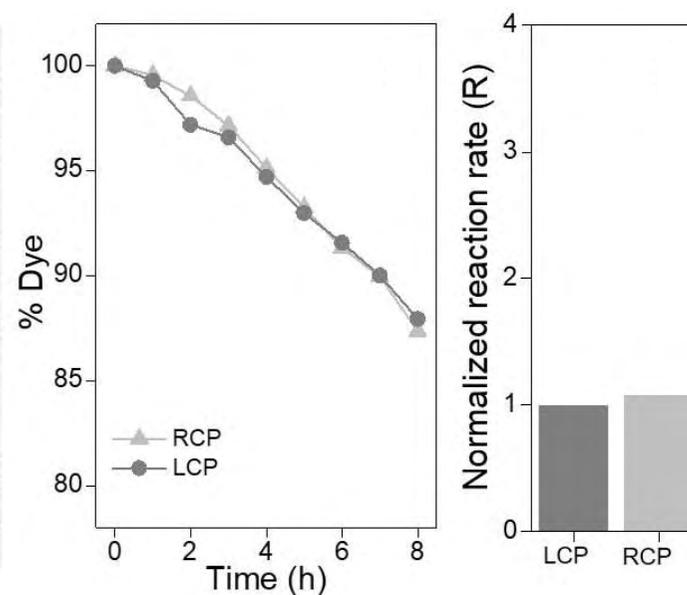

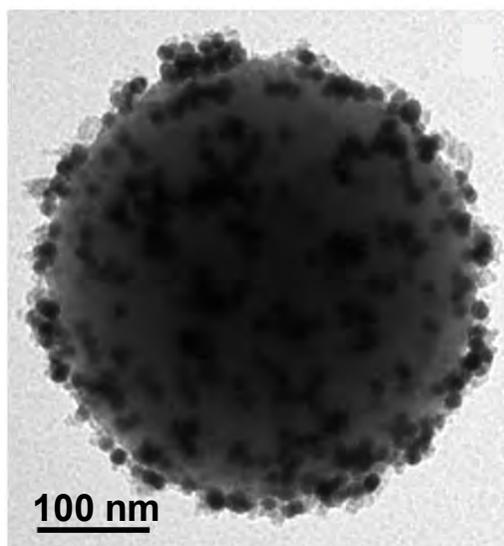

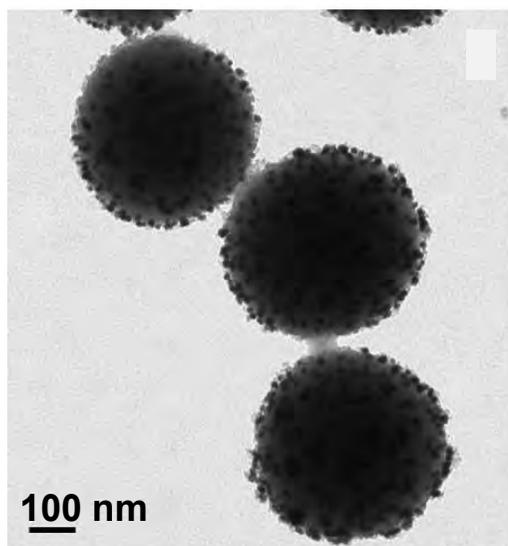

A step towards enantioselective photocatalysis?

Selective degradation of RhB

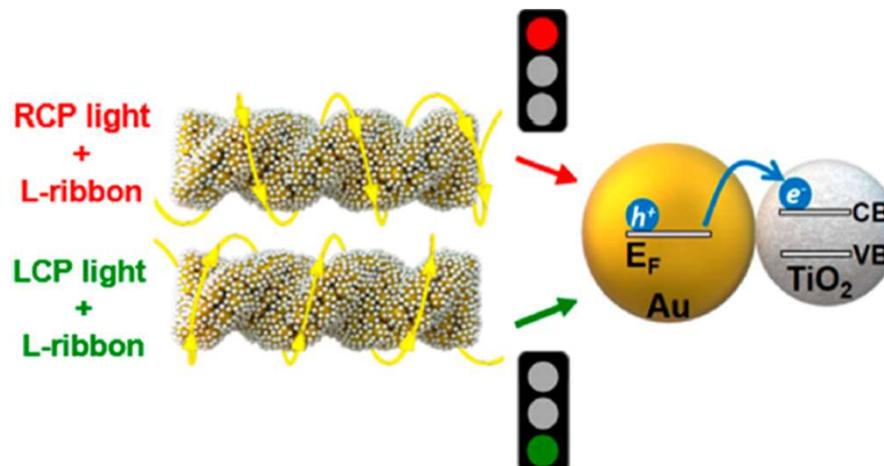

Comparison with a non-chiral sample

Can we go further with these Goldhelices?

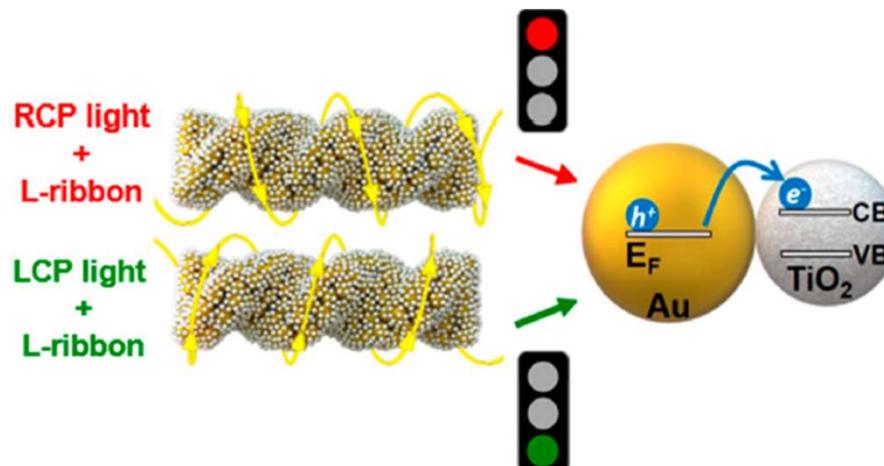

Asymmetric response of the hot carriers with respect to the helicity of CPL

NEXT STEP? Asymmetric photocatalysis?

Can we go further with these Goldhelices?

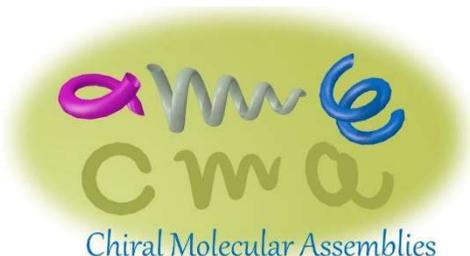

Asymmetric response of the hot carriers with respect to the helicity of CPL

Chiral plasmonic for photocatalysis

starting in November
